

AI Workflow Audit and Tool Setup (Code: FL-01)

Track:	General AI Fluency	Phase:	Setup & Onboarding
Type:	Assignment Submission	Workload:	4 Hours

1. Workflow Audit Table

Weekly recurring tasks classified by AI collaboration level with direct operational rationales:

Task Description	Classification	One-Line Operational Rationale
Athletic practice & physical training	Just Me	Requires direct physical presence, muscle memory, and real-time bodily feedback.
Leading live team briefings	Just Me	Demands real-time emotional intelligence, situational judgment, and direct human presence.
Attending live hackathons & competitions	Just Me	Relies on fast manual problem solving under high time pressure and in-person collaboration.
System architecture & logic design	Collaborate with AI	I define core business rules and constraints while AI helps map unexpected edge cases.
Debugging core program logic	Collaborate with AI	I isolate the failing component, and AI assists by scanning for subtle syntax or flow errors.
Drafting project & event proposals	Collaborate with AI	I provide raw parameters and requirements while AI helps structure the document clearly.
Pre-exam active recall & conceptual review	Collaborate with AI	I input specific topics, and AI generates targeted questions to test understanding depth.
Drafting social & workshop announcements	Delegate with Review	AI generates the first draft, and I edit it to ensure accurate voice and tone.
Writing boilerplate database queries	Delegate with Review	AI writes repetitive baseline schemas, which I review for structural correctness.
Summarizing long technical documentation	Delegate with Review	AI extracts core takeaways, which I quickly verify against original source specs.
Syncing code commits to remote repo	Fully Automate	Managed completely through automated git triggers and automated pipeline scripts.
Backing up local project files to cloud	Fully Automate	Handled by scheduled background synchronization requiring zero manual input.
Sorting & labeling incoming emails	Fully Automate	Managed through automated mailbox rules that categorize messages into folders.

2. Tool Accounts & Academy Enrollment Evidence

- **ChatGPT Setup:** Active account configured for rapid debugging and conceptual query exploration.
- **Claude Setup:** Configured workspace optimized for long-context analysis and project instruction templates.
- **Anthropic Academy Enrollment:** Enrolled in "AI Fluency: Framework & Foundations"; **Module 1 Completed** (core LLM mechanics, context handling, and structured prompting).

3. Claude Project Configuration & Custom Instructions

Configured workspace under project scope "Technical Architecture & Workflow Audit":

Claude Project Settings • Project: Technical Architecture & Workflow Audit

Status: Configured & Active

[User Context & Focus]

- Domain: Computer Science, Systems Development, Security Architecture, and Core Software Fundamentals.

[Communication & Tone Preferences]

- Direct, clear peer-to-peer style; zero filler or sterile robotic language; no Em dashes in output.
- Keep technical explanations concise, practical, and structured strictly to the requested scope.

[Current Objectives]

- Optimize code review workflows, streamline project documentation, and build reproducible AI pairing habits.

4. Target Audit Tasks & Measurable Success Definitions (For FL-02 to FL-04)

Three target tasks selected from the audit table with concrete definitions of "done well":

Task 1: Debugging and Optimizing Complex Systems Code

Definition of Done Well: The refactored code compiles cleanly with zero warnings, passes all unit edge tests, provides an explicit explanation of the underlying logic flaw, and demonstrates an optimized time/memory footprint without introducing software bugs.

Task 2: Drafting Technical Documentation & Case Studies

Definition of Done Well: The document structure is fully complete with clear workflow logic, dependency trees, and syntax specs. It satisfies a zero-fluff standard, reads naturally in clear human phrasing, and eliminates generic placeholder templates.

Task 3: Synthesizing Complex Technical Specifications & APIs

Definition of Done Well: Dense technical text is compressed into scannable key takeaways with 100% fidelity on parameter limits, protocol versions, and environment variables, eliminating all generic high-level descriptive padding.
