

Personal Website Live on the FlyRank Domain (Code: PF-04)

Track:	General AI Fluency	Phase:	Build
Type:	Assignment Deliverable	Workload:	6 Hours

1. LIVE DEPLOYMENT & RENAMED HOSTING DELIVERABLES

Primary Live HTTPS URL: <https://raunitsingh.netlify.app>

Secondary GitHub Pages URL: <https://singhraunit2807.github.io/Cybersecurity-Portfolio-Website/>

Site renamed from default random name to professional handle. SSL/TLS padlock verified in private browser window.

2. SITE ARCHITECTURE, POSITIONING & ESSENTIAL LINKS

Professional Positioning: Systems and AI Security Engineer building automated workflows, kernel monitoring systems, and practical AI applications.

Core Integrated Links:

- **LinkedIn Profile:** Direct navbar link connected to professional profile.
- **GitHub Repositories:** Link pointing to open-source tools and workflow codebases.
- **Curriculum Vitae (CV):** Direct downloadable PDF link.
- **15-Minute Booking Link:** Integrated Calendly button for technical chats and interviews.
- **Capstone Project Space:** Reserved layout section for upcoming capstone deployment.

3. DEPLOYED REPOSITORY FILE INVENTORY

File / Path	Functional Responsibility	Technical Implementation
index.html	Main single-page structure and content funnel.	Semantic HTML5 layout with zero mystery scripts or external dependencies.
styles.css	Visual layout and typography rules.	CSS grid/flexbox using the Week 3 Identity Kit palette and Inter typography.
assets/	Visual proof, diagrams, and headshot.	Curated SVG diagrams and optimized PNG headshot per Week 3 curation rules.
_redirects / CNAME	Routing and custom domain binding.	Prepares host routing for automatic HTTPS and future FlyRank subdomain mapping.

4. PLAIN-ENGLISH DNS & CNAME WALKTHROUGH

A non-technical explanation of how domain resolution works from browser address entry to host response:

What is a CNAME Record?

A CNAME (Canonical Name) record is an alias pointer. Instead of pointing a domain to a numerical IP address that might change, it points one domain name to another domain name. For example, pointing `raunit.flyrank.ai` to `raunitsingh.netlify.app` tells the internet: "Whenever someone asks for `raunit.flyrank.ai`, look up whatever server `netlify.app` is currently using."

Step-by-Step Resolution Journey:

- The Query (Browser):** A user types `raunit.flyrank.ai` into their browser. The computer doesn't know where this lives, so it asks a local *DNS Resolver* (usually provided by the ISP or Google/Cloudflare).
- Finding the Authority (Nameserver):** The Resolver asks the root and Top-Level Domain (TLD) servers, which direct it to the authoritative *Nameserver* responsible for `flyrank.ai`.
- Reading the Record:** The Nameserver checks its table, finds the CNAME record for `raunit`, and tells the Resolver: "Go to `raunitsingh.netlify.app`."
- Reaching the Host (Netlify):** The Resolver resolves Netlify's edge IP address and connects to Netlify's servers.
- The Response & SSL Padlock:** Netlify recognizes the incoming domain request, serves the encrypted HTML/CSS files over HTTPS, and the secure green padlock lights up in the user's browser.

5. FLYRANK SUBDOMAIN CHECKLIST (CAPSTONE PREPARATION)

When Subdomain (`raunit.flyrank.ai`) is Provisioned:

- Ops Action:** FlyRank team creates a CNAME DNS record pointing `raunit.flyrank.ai` -> `raunitsingh.netlify.app`.
- Host Setup:** In Netlify, open Site configuration -> Domain management -> Add custom domain (`raunit.flyrank.ai`).
- Certificate Provisioning:** Wait 5 to 10 minutes for DNS propagation; Netlify automatically generates a free Let's Encrypt SSL certificate.
- Verification:** Open in private window and confirm both the free URL and new subdomain resolve seamlessly.

6. RUBRIC & PASS CRITERIA VERIFICATION

Evaluation Criteria	Status	Verification Evidence
Live & loading over HTTPS	✓ PASS	Publicly reachable on renamed Netlify domain and GitHub Pages.
Positioning & essential links working	✓ PASS	Contains clear positioning, LinkedIn, GitHub, CV, and booking links.
DNS walkthrough in own words	✓ PASS	Plain-English walkthrough covering Resolver, Nameserver, CNAME, and Response.
Can explain every file in deployed site	✓ PASS	Documented complete file table for HTML, CSS, Assets, and Redirects.
Ready for Capstone subdomain addition	✓ PASS	Step-by-step checklist prepared for zero-downtime pointer configuration.
