

Draw the Path: Portfolio Sitemap + Toolkit (Week 1)

Track:	General AI Fluency	Phase:	Setup & Onboarding
Type:	Assignment Deliverable	Workload:	3 Hours

1. Single-Page Portfolio Sitemap & Visual Funnel Sketch

A lean 4-node structural funnel designed to lead a visitor from the initial claim directly to the single target action:

2. Configured Free AI Toolkit

Accounts initialized across core platforms, each mapped to its practical strength for the 8-week build:

Tool / Platform	Primary Role in 8-Week Build Workflow	Account Status
Claude	Long-context architectural reviews, project tutoring, and multi-file logic validation.	Active / Configured
ChatGPT	Rapid syntax debugging, utility script drafting, and quick technical sanity checks.	Active / Configured
Gemini	Large document synthesis, API specification parsing, and dataset context indexing.	Active / Configured
Perplexity	Live documentation search, verifying current library versions, and syntax lookups.	Active / Configured

3. Configured Claude Project: Custom Instructions & Proof Statement

Dedicated Claude project initialized with permanent tutor rules and core positioning:

Claude Project Settings • Workspace: Portfolio Build & Tutor

Status: Locked & Active

[Tutor Role & Operating Instructions]

Act as a strict, practical technical tutor for the next eight weeks while I build out my portfolio website. Your goal is to keep me focused, challenge my assumptions, and ensure every element on the site directly supports my primary claim and core action. Do not suggest adding extra pages or features just because they are common. Keep all explanations simple, direct, and functional. Avoid robotic filler and generic praise.

[Target Proof Statement]

- **Core Claim:** Building robust digital solutions with a focus on systems architecture, practical automation, and security-minded development.
- **Target Audience:** Technical recruiters, engineering leads, and potential project collaborators.
- **Primary Action:** Direct message or email outreach via the contact section to schedule technical interviews or discuss collaboration.

4. First Real Prompt: Sitemap Pressure-Test Log

The Prompt Sent to Claude:

"Pressure-test this 4-section single-page sitemap (Hero -> Case Studies -> About -> Contact) against my target audience (recruiters/leads) and primary action (direct outreach). Identify any points where the visitor might lose focus, get distracted, or bounce."

Summary of Claude's Pressure-Test Output:

The overall linear flow works well because it removes complex menus that cause visitors to wander. However, Claude highlighted a real risk: if the case studies look like generic design cards with shallow summaries, technical evaluators will bounce before reaching the About or Contact sections. The proof must show actual architectural reasoning, constraints, and metrics right away.

5. Specific Structural Change Adopted

Change Identified & Applied to Layout:

Based on the pressure-test feedback, I removed generic card carousels from the Case Studies section. Instead, each project case study will feature a direct "Problem → Architecture Decision → Measurable Result" breakdown with visible code/schema snippets. This gives the reviewer immediate proof of depth within the first 30 seconds of scrolling.
