

What Are You Proving? (Week 1 Setup)

Track: General AI Fluency
Type: Assignment Deliverable

Phase: Setup & Positioning
Workload: 2 Hours

1. The Proof Statement (One Claim, One Person, One Action)

I build full-stack web applications featuring voice-driven intelligent automation interfaces. I am targeting technical engineering hiring leads who evaluate early-career developers on their ability to build and deploy complex, working automation tools. The single most important action I want them to take is to click my contact scheduling link to set up a direct introductory technical discussion.

One Claim: Full-stack apps with voice-driven automation

One Person: Technical engineering hiring leads

One Action: Click scheduling link for technical call

2. AI Narrowing Log (Thinking Partner Interview)

A record of using AI as a thinking partner to challenge multiple vague skills into a single, true capability:

AI Partner Challenge: "Your initial draft mentioned full-stack engineering, AI automation, and network security all together. That hides behind 'and'. If a hiring manager has 30 seconds, what is the single underlying capability that everything else supports?"

My Narrowed Response: "The primary skill is building end-to-end full-stack software. The voice automation interface is the concrete application layer, while security and performance are execution standards applied to that code rather than separate claims."

3. The Honest Core Reason (Why This Must Exist Beyond a CV)

The One-Line Reason: A static CV or LinkedIn profile only lists keywords and claims, but cannot prove live code performance, architectural decision-making, or real-time error handling under practical deployment constraints.
